

SYMBIOTIC NETWORKS OF BIO - WASTE SUSTAINABLE MANAGEMENT

For a cleaner, healthier, more beautiful environment

SYMBIOSIS

**INDUSTRIAL SYMBIOSIS** is an innovative approach that creates industrial networks that process waste, trade in materials, energy and water in order to provide economic, environmental and social benefits for the communities.

**SYMBIOSIS PROJECT** promotes re-manufacturing, reuse and recycling of bio-waste and transforms one industry's waste to another's raw material and/or fuel. Such approach opens the way of circular economy in the cross-border region, where the waste deposited at the landfills is significantly reduced and the resources are used in an efficient and sustainable way.
